

SOIL SAMPLING + VARIABLE RATE TECHNOLOGY

By utilizing Variable Rate Technology (VRT), we can create a unique fertility plan that will help you produce more from every acre of your land while reducing the amount of waste produced. A prescription made from soil test results might recommend low quantities of a product in lesser producing areas while using more in higher producing areas to push yield. The idea is, why waste expensive fertilizer on places that don't need it by laying the same amount on every acre? While environmental sustainability is undeniably important, sustainability of your farm is what we're talking about. Reducing soil damage and maximizing your operation's lifespan is the long-term goal.
